and their agriculturally useful salts.

Moreover, the invention relates to processes for preparing compounds of the formula I, to compositions comprising them and to the use of these derivatives or the compositions comprising them for controlling harmful plants.

The literature, for example WO 98/12 180 and EP-A 283 261, discloses quinolinoyl or fused phenyl derivatives which are linked to an unsubstituted or substituted (1-hydroxy-3-oxo-cyclohex-1-en-2-yl)carbonyl radical. However, the herbicidal properties of the prior art compounds and their compatibility with crop plants are not entirely satisfactory.

It is an object of the present invention to provide other biologically, in particular herbicidally, active compounds.

We have found that this object is achieved by the cyclohexenonequinolinoyl derivatives of the formula I and their herbicidal action.

Furthermore, we have found herbicidal compositions which comprise the compounds I and have very good herbicidal action. Moreover, we have found processes for preparing these compositions and

methods for controlling undesirable vegetation using the compounds I.

Depending on the substitution pattern, the compounds of the formula I may contain one or more chiral centers, in which case they are present as enantiomers or mixtures of diastereomers. The invention provides both the pure enantiomers or diastereomers and their mixtures.

The compounds of the formula I may also be present in the form of their agriculturally useful salts, where the type of salt is usually immaterial. In general, the salts of those cations and the acid addition salts of those acids are suitable whose cations and anions, respectively, do not negatively affect the herbicidal action of the compounds I.

Suitable cations are, in particular, ions of the alkali metals, preferably lithium, sodium and potassium, of the alkaline earth metals, preferably calcium and magnesium, and of the transition metals, preferably manganese, copper, zinc and iron, and also ammonium, where, if desired, one to four hydrogen atoms may be replaced by C_1–C_4–alkyl, hydroxy–C_1–C_4–alkyl, C_1-C_4-alkoxy-C_1-C_4-alkyl, hydroxy-C_1-C_4-alkoxy-C_1-C_4-alkyl, phenyl or benzyl, preferably ammonium, dimethylammonium, diisopropylammonium, tetramethylammonium, tetrabutylammonium, 2-(2-hydroxyeth-1-oxy)eth-1-ylammonium, di(2-hydroxyeth-1-yl)ammonium, trimethylbenzylammonium, furthermore phosphonium ions, sulfonium ions, preferably tri(C_1–C_4–alkyl)sulfonium and sulfoxonium ions, preferably tri(C_1–C_4–alkyl)sulfoxonium.

Anions of useful acid addition salts are primarily chloride, bromide, fluoride, hydrogen sulfate, sulfate, dihydrogen phosphate, hydrogen phosphate, nitrate, hydrogen carbonate, carbonate, hexafluorosilicate, hexafluorophosphate, benzoate and also the anions of C_1–C_4–alkanoic acids, preferably formate, acetate, propionate and butyrate.

The organic moieties mentioned for the substituents R^1–R^{12} or as radicals on phenyl and heterocyclyl radicals are collective terms for individual enumerations of the particular group members. The cyclohexenonequinolinoyl derivatives of the formula I can be obtained by various routes, for example by the following processes:

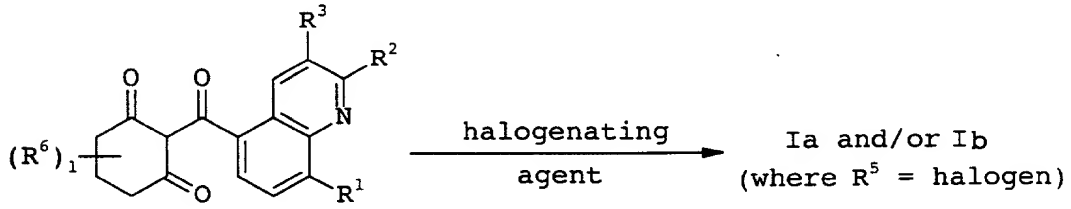
A. Preparation of compounds of the formula I where R^5 = halogen by reaction of cyclohexanedione derivatives of the formula III with halogenating agents:



III

Suitable halogenating agents are, for example, phosgene, diphosgene, triphosgene, thionyl chloride, oxalyl chloride, phosphorus chloride, phosphorus pentachloride, mesyl chloride, chloromethylene-N,N-dimethylammonium chloride, oxalyl bromide, phosphorus oxybromide etc.

B. Preparation of compounds of the formula I where $R^5 = OR^7$, OSO_2R^8, OPR^8R^9, $OPOR^8R^9$ or $OPSR^8R^9$ by reaction of cyclohexane dione derivatives of the formula III with alkylating, sulfonylating or phosphonylating agents IVα, IVβ, IVγ, IVδ or IVε.

↓

Ia and/or Ib
(where R^5 = OR^7, OSO_2R^8, OPR^8R^9, $OPOR^8R^9$ or $OPSR^8R^9$)

L^1 is a nucleophilically replaceable leaving group, such as halogen, for example chlorine or bromine, hetaryl, for example imidazolyl, carboxylate, for example acetate, or sulfonate, for example mesylate or triflate, etc.

The compounds of the formula IVα, IVβ, IVγ, IVδ or IVε can be employed directly such as, for example, in the case of the carbonyl halides, or generated in situ, for example activated carboxylic acids (using carboxylic acid and dicyclohexyl carbodiimide, etc.).

C. Preparation of compounds of the formula I where R^5 = OR^7, SR^7, POR^8R^9, $NR^{10}R^{11}$, $ONR^{11}R^{12}$, N-linked heterocyclyl or O-(N-linked heterocyclyl) by reaction of compounds of the formula I where R^5 = halogen, OSO_2R^8 (Iα) with compounds of the formula Vα, Vβ, Vγ, Vδ, Vε, Vη or Vϑ, if appropriate in the presence of a base or with prior formation of salt.

D. Preparation of compounds of the formula I where R^5 = SOR^8, SO_2R^8 by reaction of compounds of the formula I where R^5 = SR^8 (Iβ) with an oxidizing agent.

Ia and/or Ib (where R^5 = SR^8) —oxidizing agent→ Ia and/or Ib (where R^5 = SOR^8 or SO_2R^8)

Suitable oxidizing agents are, for example, m-chloroperbenzoic acid, peroxy acetic acid, trifluoroperoxy acetic acid, hydrogen peroxide, if appropriate in the presence of a catalyst such as tungstate.

The following conditions apply to the abovementioned reactions:

The starting materials are generally employed in equimolar amounts. However, it will also be advantageous to employ an excess of one or the other component.

If appropriate, it may be advantageous to carry out the reactions in the presence of a base. Here, the starting materials and the base are advantageously employed in equimolar amounts. An excess of base, for example 1.5 to 3 molar equivalents, based on Ia

and/or Ib (where R^5 = halogen or OSO_2R^8) or III may in certain cases be advantageous.

Suitable bases are tertiary alkyl amines, such as triethylamine, aromatic amines, such as pyridine, alkali metal carbonates, for example sodium carbonate or potassium carbonate, alkali metal bicarbonates, such as sodium bicarbonate and potassium bicarbonate, alkali metal alkoxides, such as sodium methoxide, sodium ethoxide, potassium tert-butoxide or alkali metal hydrides, for example sodium hydride. Preference is given to using triethylamine or pyridine.

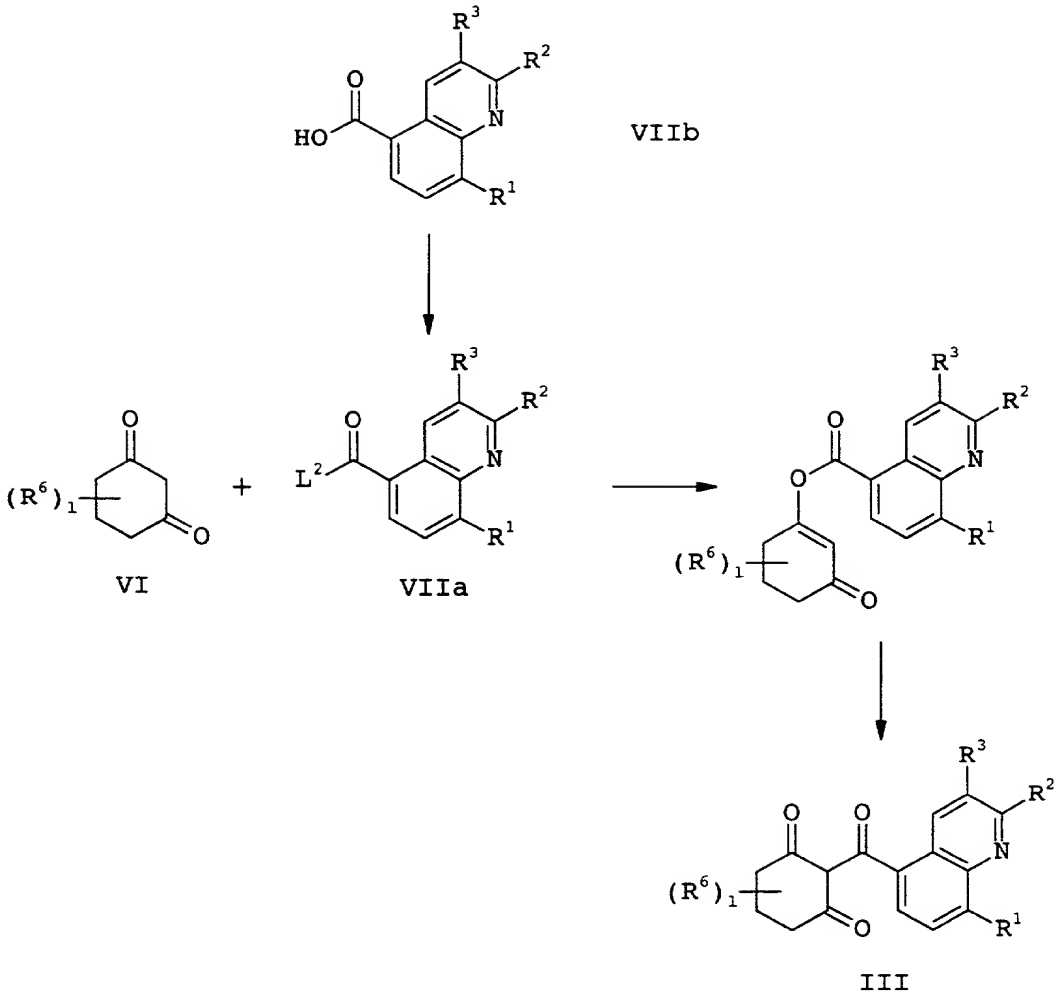
Suitable solvents are, for example, chlorinated hydrocarbons, such as methylene chloride or 1,2—dichloroethane, aromatic hydrocarbons, for example toluene, xylene or chlorobenzene, ethers, such as diethyl ether, methyl—tert—butyl ether, tetrahydrofuran or dioxane, polar aprotic solvents, such as acetonitrile, dimethyl formamide or dimethyl sulfoxide, or esters, such as ethyl acetate, or mixtures of these.

The reaction temperature is generally in the range of from 0°C to the boiling point of the reaction mixture.

Work-up to give the product can be carried out in a manner known per se.

Depending on the reaction conditions, the compounds Ia, Ib or mixtures of these can be formed. The latter can be separated by classical separation methods, such as, for example, crystallization, chromatography, etc.

The cyclohexanedione derivatives of the formula III are known or can be prepared by processes known per se (for example DE-A 19 532 311), for example by reacting cyclohexanones of the formula VI with an activated benzoic acid VIIa or a benzoic acid VIIb, which is preferably activated in situ, to give the acylation product which is subsequently rearranged.



L^2 is a nucleophilically replaceable leaving group, such as halogen, for example bromine or chlorine, hetaryl, for example imidazolyl or pyridyl, carboxylate, for example acetate or trifluoroacetate, etc.

The activated benzoic acid VIIa can be employed directly, such as in the case of the benzoyl halides, or be generated in situ, for example using dicyclohexyl carbodiimide, triphenylphosphine/azodicarboxylic ester, 2-pyridine disulfide/triphenyl phosphine, carbonyldiimidazole, etc.

If appropriate, it may be advantageous to carry out the acylation reaction in the presence of a base. Here, the starting materials and the auxiliary base are advantageously employed in equimolar amounts. A slight excess of the auxiliary base, for example from 1.2 to 1.5 molar equivalents, based on VII, may be advantageous in certain cases.

Suitable auxiliary bases are tertiary alkyl amines, pyridine or alkali metal carbonates. Suitable solvents are, for example, chlorinated hydrocarbons, such as methylene chloride or 1,2-dichloroethane, aromatic hydrocarbons, such as toluene, xylene or chlorobenzene, ethers, such as diethyl ether, methyl tert-butyl ether, tetrahydrofuran or dioxane, polar aprotic solvents, such as acetonitrile, dimethylformamide or dimethyl sulfoxide, or esters, such as ethyl acetate, or mixtures of these.

If the activated carboxylic acid component employed is a benzoyl halide, it may be advantageous to cool the reaction mixture to 0—10°C on addition of this reaction partner. The mixture is subsequently stirred at 20 — 100°C, preferably at 25 — 50°C, until the reaction is complete. Work-up is carried out in a customary manner, for example the reaction mixture is poured into water and the product of value is extracted. Solvents which are suitable for this purpose are, in particular, methylene chloride, diethyl ether and ethyl acetate. The organic phase is dried and the solvent is removed, after which the crude ester can be employed without any further purification for the rearrangement.

The rearrangement of the esters to the compounds of the formula III is advantageously carried out at 20 - 100°C in a solvent and in the presence of a base and, if appropriate, with the aid of a cyano compound as catalyst.

Suitable solvents are, for example, acetonitrile, methylene chloride, 1,2-dichloroethane, dioxane, ethyl acetate, toluene or mixtures of these. Preferred solvents are acetonitrile and dioxane.

Suitable bases are tertiary amines, such as triethylamine, aromatic amines, such as pyridine, or alkali metal carbonates, such as sodium carbonate or potassium carbonate, which are preferably employed in an equimolar amount, or up to a four-fold excess, based on the ester. Preference is given to using triethylamine or alkali metal carbonate, preferably in twice the equimolar amount, based on the ester.

Suitable cyano compounds are inorganic cyanides, such as sodium cyanide or potassium cyanide, and organic cyano compounds, such as acetone cyanohydrin or trimethylsilyl cyanide. They are employed in an amount from 1 to 50 mol percent, based on the ester. Preference is given to using acetone cyanohydrin or

trimethylsilyl cyanide, for example in an amount from 5 to 15, preferably 10, mol percent, based on the ester.

Work-up can be carried out in a manner known per se. For example, the reaction mixture is acidified with dilute mineral acid, such as 5% strength hydrochloric acid, or sulfuric acid, and extracted with an organic solvent, for example methylene chloride or ethyl acetate. The organic extract can be extracted with 5–10% strength alkali metal carbonate solution, for example sodium carbonate or potassium carbonate solution. The aqueous phase is acidified and the resulting precipitate is filtered off with suction and/or extracted with methylene chloride or ethyl acetate, dried and concentrated.

The benzoyl halides of the formula VIIa (where L^2 = Cl, Br) can be prepared in a manner known per se by reaction of the benzoic acids of the formula VIIb with halogenating agents, such as thionyl chloride, thionyl bromide, phosgene, diphosgene, triphosgene, oxalyl chloride, oxalyl bromide.

The benzoic acids of the formula VIIb can be prepared in a known manner from the corresponding esters by acidic or basic hydrolysis. The latter are known from the literature or can be prepared in a manner known per se.

8-Difluoromethyl-5-alkoxycarbonyl-quinolines can be obtained from the corresponding 8-aldehyde derivatives by fluorination. A suitable fluorinating agent is, inter alia, DAST. The formyl quinoline is obtained by oxidation of the corresponding bromomethyl quinoline.

Furthermore, it is possible to obtain 8-difluoromethoxy-5-alkoxycarbonyl-quinolines from the corresponding 8-hydroxy derivatives by reaction with chlorodifluoromethane. This reaction is preferably carried out in the presence of a base, such as potassium hydroxide or sodium hydroxide, in an aprotic solvent. The 8-hydroxy-5-alkoxycarbonylquinolines are obtained from 8-hydroxy-5-hydroxycarbonyl-quinoline by esterification reactions which are known per se.

The solvent was then removed and the residue was taken up in ice-water, adjusted to a pH of 8 using sodium carbonate solution and filtered hot. The residue was extracted with methyl-tert-butyl ether for 7 hours on a jacketed Soxhlet extractor, and the solvent was subsequently removed from the extract. This gave 6.8 g of a brown powder;
^{1}H-NMR (δ in ppm, d^6-DMSO): 9.38 (d, 1H); 8.90 (d, 1H); 8.26 (d, 1H); 7.71 (dd, 1H); 7.15 (d, 1H); 3.93 (s, 3H).

Step b) Methyl 8-difluoromethoxy-5-quinolinecarboxylate

1.0 g (5.0 mmol) of methyl 8-hydroxy-5-quinolinecarboxylate was dissolved in 20 ml of dimethylformamide, 0.76 g (5.5 mmol) of potassium carbonate was added and 14 g of chlorodifluoromethane were introduced at 40°C over a period of 2 hours. Solid components were then filtered off, the solvent was removed and the residue was washed with water and dried. This gave 0.75 g of a brown powder;

^{1}H-NMR (δ in ppm, $CDCl_3$): 9.45 (d,1H); 9.00 (d, 1H); 8.30 (d, 1H); 7.61 (dd, 1H); 7.49 (d, 1H); 7.18 (t, 1H); 3.99 (s, 3H).

Step c) 8-difluoromethoxy-5-quinolinecarboxylic acid

0.7 g (2.8 mmol) of methyl 8-difluoromethoxy-5-quinoline-carboxylate was suspended in 15 ml of water and 0.4 g (10 mmol) of sodium hydroxide was added. The mixture was stirred at 25°C for 20 hours and then filtered off, and the filtrate was washed with methyl tert-butyl ether. The aqueous phase was adjusted to pH 3 using concentrated hydrochloric acid and filtered off, and the residue was dried. This gave 0.45 g of a colorless powder;
^{1}H-NMR (δ in ppm, d^6-DMSO): 13.5 (br, 1H); 9.39 (d, 1H); 9.03 (d, 1H); 8.32 (d, 1H); 7.78 (dd, 1H); 7.62 (d, 1H); 7.60 (t, 1H).

Step d) 2-[(8-difluoromethoxyquinolin-5-yl)carbonyl]-4,4,6,6-tetramethylcyclohexane-1,3,5-trione

0.4 g (1.7 mmol) of 8-difluoromethoxy-5-quinolinecarboxylic acid was dissolved in 20 ml of acetonitrile, 0.4 g (1.9 mmol) of N,N-dicyclohexylcarbodiimide and 0.3 g (1.7 mmol) of 2,2,4,4-tetramethylcyclohexane-1,3,5-trione were added and the mixture was stirring at 25°C for 20 hours. 0.4 g (4.0 mmol) of triethylamine and 2 drops of trimethylsilyl cyanide were then added, and stirring was continued at 30-35°C for a further 3 hours. The precipitate was filtered off, and the filtrate was concentrated, 20 ml of 5% strength potassium carbonate solution were added and the mixture was washed with methyl tert-butyl ether. The aqueous phase was subsequently adjusted to pH 3 using concentrated hydrochloric acid and extracted with ethyl acetate. The solvent was removed and the residue was chromatographed over silica gel (mobile phase: methylene chloride/methanol). This gave 0.2 g of a colorless powder;
^{1}H-NMR (δ in ppm, $CDCl_3$): 16.5 (br, 1H); 9.02 (d, 1H); 8.30 (d, 1H); 7.51 (m, 2H); 7.21 (d, 1H); 7.17 (t, 1H); 1.60 (s, 6H); 1.35 (s, 6H).

In addition to the cyclohexenone quinolinoyl derivatives of the formula I described above, further derivatives which were prepared or are preparable in a similar manner or in a manner known per se are listed in Tables 2 and 3:

The compounds of the formula I and their agriculturally useful salts are suitable, both in the form of isomer mixtures and in the form of the pure isomers, as herbicides. The herbicidal compositions comprising compounds of the formula I control vegetation on non-crop areas very efficiently, especially at high rates of application. They act against broad-leaved weeds and harmful grasses in crops such as wheat, rice, maize, soya and cotton without causing any significant damage to the crop plants. This effect is mainly observed at low rates of application.

Depending on the application method used, the compounds of the formula I, or the compositions comprising them, can additionally be employed in a further number of crop plants for eliminating undesirable plants. Examples of suitable crops are the following:

Allium cepa, Ananas comosus, Arachis hypogaea, Asparagus officinalis, Beta vulgaris spec. altissima, Beta vulgaris spec. rapa, Brassica napus var. napus, Brassica napus var. napobrassica, Brassica rapa var. silvestris, Camellia sinensis, Carthamus tinctorius, Carya illinoinensis, Citrus limon, Citrus sinensis, Coffea arabica (Coffea canephora, Coffea liberica), Cucumis sativus, Cynodon dactylon, Daucus carota, Elaeis guineensis, Fragaria vesca, Glycine max, Gossypium hirsutum, (Gossypium arboreum, Gossypium herbaceum, Gossypium vitifolium), Helianthus annuus, Hevea brasiliensis, Hordeum vulgare, Humulus lupulus, Ipomoea batatas, Juglans regia, Lens culinaris, Linum usitatissimum, Lycopersicon lycopersicum, Malus spec., Manihot esculenta, Medicago sativa, Musa spec., Nicotiana tabacum (N.rustica), Olea europaea, Oryza sativa, Phaseolus lunatus, Phaseolus vulgaris, Picea abies, Pinus spec., Pisum sativum, Prunus avium, Prunus persica, Pyrus communis, Ribes sylvestre, Ricinus communis, Saccharum officinarum, Secale cereale, Solanum tuberosum, Sorghum bicolor (s. vulgare), Theobroma cacao, Trifolium pratense, Triticum aestivum, Triticum durum, Vicia faba, Vitis vinifera and Zea mays.

In addition, the compounds of the formula I may also be used in crops which tolerate the action of herbicides owing to breeding, including genetic engineering methods.

The compounds of the formula I, or the herbicidal compositions comprising them, can be used for example in the form of ready-to-spray aqueous solutions, powders, suspensions, also highly-concentrated aqueous, oily or other suspensions or dispersions, emulsions, oil dispersions, pastes, dusts, materials for broadcasting or granules, by means of spraying, atomizing,

dusting, broadcasting or watering. The use forms depend on the intended aims; in any case, they should guarantee a very fine distribution of the active compounds according to the invention.

The herbicidal compositions comprise a herbicidally effective amount of at least one compound of the formula I or of an agriculturally useful salt of I, and auxiliaries which are customary for the formulation of crop protection agents.

Essentially, suitable inert auxiliaries include:
mineral oil fractions of medium to high boiling point, such as kerosene and diesel oil, furthermore coal tar oils and oils of vegetable or animal origin, aliphatic, cyclic and aromatic hydrocarbons, e.g. paraffin, tetrahydronaphthalene, alkylated naphthalenes and their derivatives, alkylated benzenes and their derivatives, alcohols such as methanol, ethanol, propanol, butanol and cyclohexanol, ketones such as cyclohexanone, or strongly polar solvents, e.g. amines such as N-methylpyrrolidone, and water.

Aqueous use forms can be prepared from emulsion concentrates, suspensions, pastes, wettable powders or water-dispersible granules by adding water. To prepare emulsions, pastes or oil dispersions, the cyclohexenonequinolinoyl derivatives of the formula I, either as such or dissolved in an oil or solvent, can be homogenized in water by means of a wetting agent, tackifier, dispersant or emulsifier. Alternatively, it is possible to prepare concentrates comprising active substance, wetting agent, tackifier, dispersant or emulsifier and, if desired, solvent or oil, which are suitable for dilution with water.

Suitable surfactants are the alkali metal salts, alkaline earth metal salts and ammonium salts of aromatic sulfonic acids, e.g. ligno-, phenol-, naphthalene- and dibutylnaphthalenesulfonic acid, and of fatty acids, alkyl- and alkylarylsulfonates, alkyl sulfates, lauryl ether sulfates and fatty alcohol sulfates, and salts of sulfated hexa-, hepta- and octadecanols, and also of fatty alcohol glycol ethers, condensates of sulfonated naphthalene and its derivatives with formaldehyde, condensates of naphthalene, or of the naphthalenesulfonic acids with phenol and formaldehyde, polyoxyethylene octylphenol ether, ethoxylated isooctyl-, octyl- or nonylphenol, alkylphenyl or tributylphenyl polyglycol ether, alkylaryl polyether alcohols, isotridecyl alcohol, fatty alcohol/ethylene oxide condensates, ethoxylated castor oil, polyoxyethylene alkyl ethers or polyoxypropylene alkyl ethers, lauryl alcohol polyglycol ether acetate, sorbitol esters, lignin-sulfite waste liquors or methylcellulose.

Powders, materials for broadcasting and dusts can be prepared by mixing or grinding the active substances together with a solid carrier.

Granules, e.g. coated granules, impregnated granules and homogeneous granules, can be prepared by binding the active compounds to solid carriers. Solid carriers are mineral earths, such as silicas, silica gels, silicates, talc, kaolin, limestone, lime, chalk, bole, loess, clay, dolomite, diatomaceous earth, calcium sulfate, magnesium sulfate, magnesium oxide, ground synthetic materials, fertilizers such as ammonium sulfate, ammonium phosphate and ammonium nitrate, ureas, and products of vegetable origin, such as cereal meal, tree bark meal, wood meal and nutshell meal, cellulose powders, or other solid carriers.

The concentrations of the compounds of the formula I in the ready-to-use preparations can be varied within wide ranges. In general, the formulations comprise from about 0.001 to 98% by weight, preferably 0.01 to 95% by weight of at least one active compound. The active compounds are employed in a purity of from 90% to 100%, preferably 95% to 100% (according to the NMR spectrum).

The following formulation examples illustrate the production of such preparations:

I. 20 parts by weight of the compound No. 2.2 are dissolved in a mixture composed of 80 parts by weight of alkylated benzene, 10 parts by weight of the adduct of 8 to 10 mol of ethylene oxide to 1 mol of oleic acid N-monoethanolamide, 5 parts by weight of calcium dodecylbenzenesulfonate and 5 parts by weight of the adduct of 40 mol of ethylene oxide to 1 mol of castor oil. Pouring the solution into 100,000 parts by weight of water and finely distributing it therein gives an aqueous dispersion which comprises 0.02% by weight of the active compound.

Pouring the solution into 100,000 parts by weight of water and finely distributing it therein gives an aqueous dispersion which comprises 0.02% by weight of the active compound.

IV. 20 parts by weight of the compound No. 2.18 are mixed thoroughly with 3 parts by weight of sodium diisobutylnaphthalenesulfonate, 17 parts by weight of the sodium salt of a lignosulfonic acid from a sulfite waste liquor and 60 parts by weight of pulverulent silica gel, and the mixture is ground in a hammer mill. Finely distributing the mixture in 20,000 parts by weight of water gives a spray mixture which comprises 0.1% by weight of the active compound.

V. 3 parts by weight of the compound No. 2.22 are mixed with 97 parts by weight of finely divided kaolin. This gives a dust which comprises 3% by weight of the active compound.

The compounds of the formula I or the herbicidal compositions can be applied pre- or post-emergence. If the active compounds are less well tolerated by certain crop plants, application

techniques may be used in which the herbicidal compositions are sprayed, with the aid of the spraying equipment, in such a way that they come into contact as little as possible, if at all, with the leaves of the sensitive crop plants, while the active compounds reach the leaves of undesirable plants growing underneath, or the bare soil surface (post-directed, lay-by).

The application rates of the compound of the formula I are from 0.001 to 3.0, preferably 0.01 to 1.0 kg/ha of active substance (a.s.), depending on the control target, the season, the target plants and the growth stage.

To widen the activity spectrum and to achieve synergistic effects, the cyclohexenonequinolinoyl derivatives of the formula I may be mixed with a large number of representatives of other herbicidal or growth-regulating active compound groups and then applied concomitantly. Suitable components for mixtures are, for example, 1,2,4-thiadiazoles, 1,3,4-thiadiazoles, amides, aminophosphoric acid and its derivatives, aminotriazoles, anilides, (het)aryloxyalkanoic acids and their derivatives, benzoic acid and its derivatives, benzothiadiazinones, 2-aroyl-1,3-cyclohexanediones, hetaryl aryl ketones, benzylisoxazolidinones, meta-CF_3-phenyl derivatives, carbamates, quinolinecarboxylic acid and its derivatives, chloroacetanilides, cyclohexenone oxime ether derivatives, diazines, dichloropropionic acid and its derivatives, dihydrobenzofurans, dihydrofuran- 3-ones, dinitroanilines, dinitrophenols, diphenyl ethers, dipyridyls, halocarboxylic acids and their derivatives, ureas, 3-phenyluracils, imidazoles, imidazolinones, N-phenyl-3,4,5,6-tetrahydrophthalimides, oxadiazoles, oxiranes, phenols, aryloxy- and hetaryloxyphenoxypropionic esters, phenylacetic acid and its derivatives, phenylpropionic acid and its derivatives, pyrazoles, phenylpyrazoles, pyridazines, pyridinecarboxylic acid and its derivatives, pyrimidyl ethers, sulfonamides, sulfonylureas, triazines, triazinones, triazolinones, triazolecarboxamides and uracils.

It may furthermore be advantageous to apply the compounds of the formula I, alone or else concomitantly in combination with other herbicides, in the form of a mixture with other crop protection agents, for example together with agents for controlling pests or phytopathogenic fungi or bacteria. Also of interest is the miscibility with mineral salt solutions, which are employed for treating nutritional and trace element deficiencies. Non-phytotoxic oils and oil concentrates may also be added.

Use Examples

The herbicidal activity of the cyclohexenonequinolinoyl derivatives of the formula I was demonstrated by the following greenhouse experiments:

The culture containers used were plastic pots containing loamy sand with approximately 3.0% of humus as the substrate. The seeds of the test plants were sown separately for each species.

For the pre-emergence treatment, the active compounds, which had been suspended or emulsified in water, were applied directly after sowing by means of finely distributing nozzles. The containers were irrigated gently to promote germination and growth and subsequently covered with transparent plastic hoods until the plants had rooted. This cover caused uniform germination of the test plants, unless this was adversely affected by the active compounds.

For the post-emergence treatment, the test plants were first grown to a height of 3 to 15 cm, depending on the plant habit, and only then treated with the active compounds which had been suspended or emulsified in water. The test plants were for this purpose either sown directly and grown in the same containers, or they were first grown separately as seedlings and transplanted into the test containers a few days prior to treatment. The application rate for the post-emergence treatment was 0.25 or 0.125 kg of a.s. (active substance)/ha.

Depending on the species, the plants were kept at 10 - 25°C or 20 - 35°C. The test period extended over 2 to 4 weeks. During this time, the plants were tended, and their response to the individual treatments was evaluated.

The evaluation was carried out using a scale from 0 to 100. 100 means no emergence of the plants, or complete destruction of at least the aerial parts and 0 means no damage, or normal course of growth.

The plants used in the greenhouse experiments are composed of the following species:

Scientific Name	Common Name
Abutilon theophrasti	velvet leaf
Chenopodium album	lambsquarters
Galium aparine	catchweed bedstraw
Ipomoea spp.	morning glory
Setaria faberi	giant foxtail
Setaria viridis	green foxtail
Solanum nigrum	black nightshade

At application rates of 0.25 and 0.125 kg of a.s./ha, the compounds 2.2, 2.4 and 2.16, applied post-emergence, showed very good activity against harmful plants such as giant foxtail, green foxtail and black nightshade. Furthermore, the compounds 2.2 and 2.4 controlled velvet leaf and morning glory very efficiently. Compound 2.16 additionally showed excellent activity against the weeds lambsquarters and catchweed bedstraw.

where:

R^1 is hydrogen, nitro, halogen, cyano, alkyl, haloalkyl, alkoxyiminomethyl, alkoxy, haloalkoxy, alkylthio, C_1—C_6—haloalkylthio, alkylsulfinyl, haloalkylsulfinyl, alkylsulfonyl, haloalkylsulfonyl, unsubstituted or substituted amino sulfonyl, unsubstituted or substituted sulfonyl amino, unsubstituted or substituted phenoxy, unsubstituted or substituted heterocyclyloxy, unsubstituted or substituted phenylthio or unsubstituted or substituted heterocyclylthio;

R^2, R^3 are hydrogen, alkyl, haloalkyl or halogen;

R^4 is substituted (3-oxo-1-cyclohexen-2-yl)carbonyl or substituted (1,3-dioxo-2-cyclohexyl)methylidene;

and their agriculturally useful salts;

processes for preparing the cyclohexenonequinolinoyl derivatives; compositions comprising them, and the use of these derivatives or compositions comprising them for controlling undesirable plants are described.
